AXOOM SOLUTIONS

Transform your company into a smart factory with solutions from AXOOM

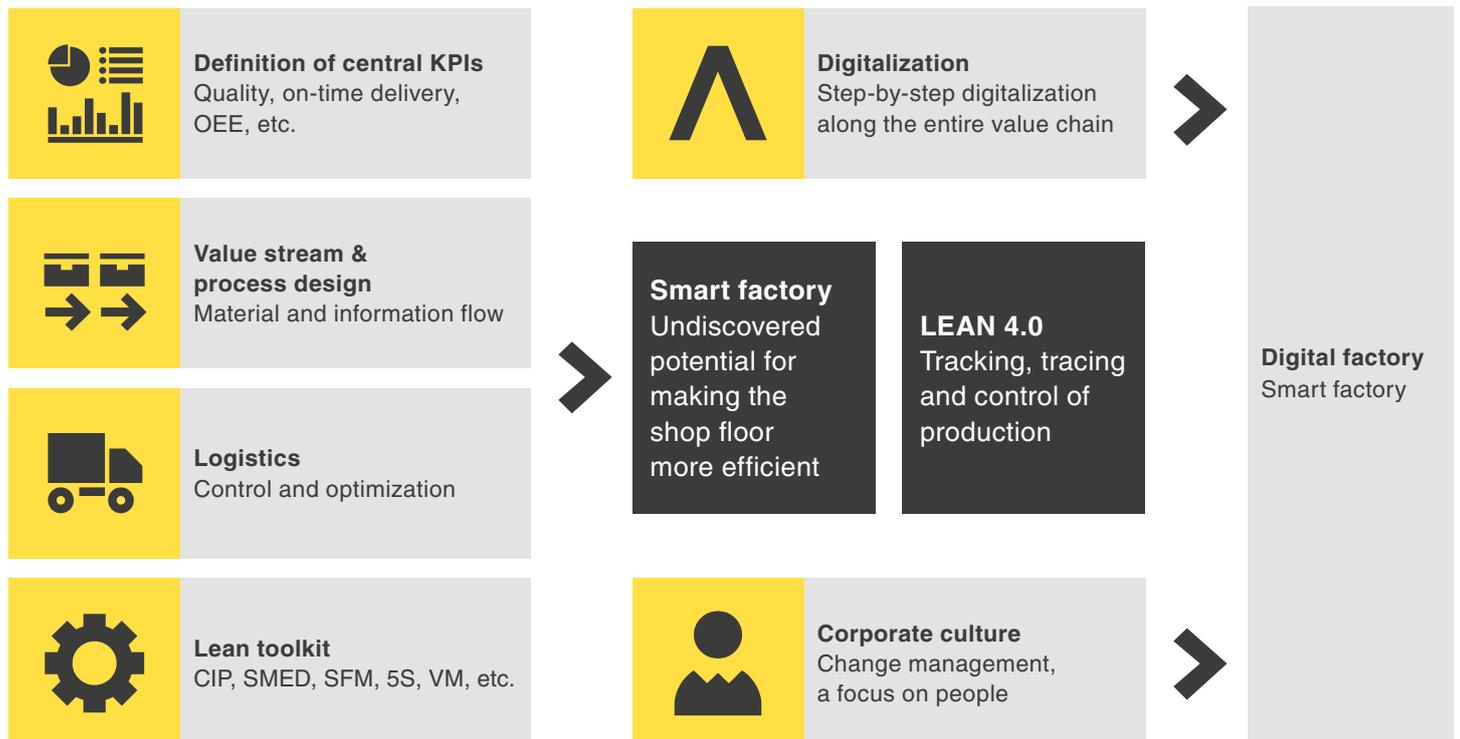

The global market is drastically changing the requirements placed on manufacturing companies. Ever smaller batch sizes and an increasing number of variants make production more complex.

In this context, throughput, costs and quality can be improved by standardizing and digitalizing traditional manufacturing processes. Existing software solutions also have to be reassessed and interaction with employees has to be simplified considerably.

Lean Management

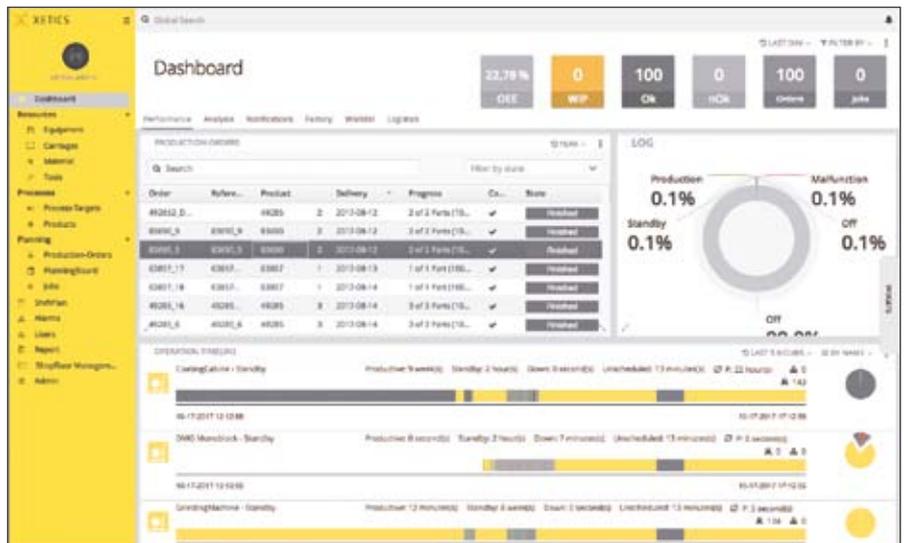

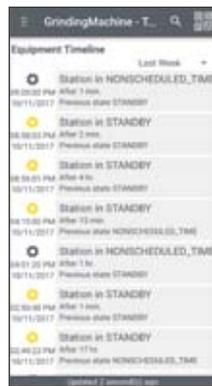

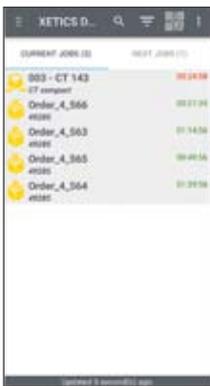

Our experts help you on your way toward becoming a smart factory and reveal undiscovered potential within your value chain. By visualizing your entire manufacturing process flow in a clear way, we enable you to concentrate on what's important, better manage the unexpected and thus produce more efficiently. We create the basis for planning, controlling and optimizing your production activities transparently while focusing on the value stream.

XETICS LEAN – an integral part of our system.

When devising your smart factory solution, we call on the expertise of XETICS LEAN. Here, manufacturing processes are recorded using mobile devices, app-based software components and smart tags such as DMC, QR codes, barcodes or NFC. Machine data from controllers can be used as well.

XETICS LEAN has been created entirely according to lean principles. It continuously compiles all relevant production data in the form of key performance indicators and clearly presents up-to-date results of your production activities. Data acquired during operations and from machines, manufacturing execution systems and production planning and control systems is depicted in a holistic information infrastructure.

You have things under control at all times with our transparent solution:

- > Your production output
- > Your factory's stocks
- > The availability and utilization rate of stations and machines
- > Real-time quality data from your manufacturing processes

Your benefits:

- > You boost the efficiency and quality of your production activities
- > You can increasingly guarantee on-time delivery
- > Activities not creating any value are reduced
- > A modern IT infrastructure makes it possible to digitalize your factory and for employees to interact along the value chain
- > Clear presentation
- > You can focus on what matters
